

Just look at these money-saving, comfort-enhancing, health-promoting, Earth-saving reasons for owning a David Weekley Green Home.

High-Performance Air Conditioning and Hard-Cast Sealed Ductwork

Our very efficient 14 SEER air conditioning system cools your home with less electricity. Less electricity means less money out of your pocket and reduced power company emissions. Also, to avoid unnecessary cooling of your attic, we've cut ductwork leakage from up to 20% to less than 3% (verified by 3rd party testing and inspection). Unless you have a good reason to cool your attic, you'll enjoy the opportunity to save on energy usage – especially the impact it can have on your bills.

Jump Ducts and Air Pressure Balancing

A jump duct is a flexible duct that connects a bedroom or closed room to an open space in the home. This allows the air coming into this closed room to be pushed through the jump ducts (by air pressure) into common areas. This "air blending" helps even out temperatures in your home and also helps the air conditioning system operate more efficiently. You can close your bedroom doors and stay comfortable in a David Weekley Green Home. We think that's a lot better than those large gaps between the door and the floor that other builders are using.

Improved Thermal Envelope System

The thermal envelope can be defined as the sum total of the parts of a building separating the exterior environment from the interior. Within this envelope, windows are one of the biggest energy drains. David Weekley minimizes this loss with Low E energy-efficient glass. And we use vinyl window frames because metal ones radiate heat and can sweat in humidity. Insulation plays an integral role in protecting you from outside temperature extremes. An R-13 wall system coupled with R-38 blown-in insulation in the attic helps you maintain control of your indoor temperature. Radiant Barrier Decking used with shingled roofing keeps your attic cooler and your air conditioning system running more efficiently. Sill Seal foam gaskets between the framing and concrete foundation complete the envelope for a well-designed Green Home.

Bigger is No Longer Better in Air-Conditioning

Leaky walls and bad windows once meant huge air conditioning systems. David Weekley's superior building envelope and more efficient ductwork require a smaller air conditioning system. The two main goals of air conditioning are to cool and to de-humidify for optimum comfort. David Weekley air conditioning systems are right sized and carefully designed using ASHRAE Manual J standards to avoid "short-cycling," meaning they won't shut off before drying the air. You're more comfortable and able to control energy usage better by cooling with a smaller system.

Water Management

Managing clean, potable water is a crucial part of our Green Home program. By using water-saving shower heads, faucets, and high performance commodes, we give you the ability to reduce internal water usage and help conserve our most precious resource.

Cement Board Tile Backer and Anti-Fracture Coatings

Mold likes paper as food. Drywall (a paper-backed product) is commonly used behind tile in shower and bath areas. We use cement-based products instead of drywall. We also fill the cement board seams with a rubber-like product called anti-fracture membrane to reduce the prospect of water damage when tile is no longer "water tight."

Recycled Materials

Excess building materials re-engineered into stronger, superior products help save a little bit of the environment and deliver a better home. Our radiant barrier oriented strand board roof sheathing is a good example. By recycling previously used wood components, then orienting for structural integrity, we better utilize our natural resources.

Performance Verification

Each and every home we build in our green program is required to undergo independent third party performance verification inspections. While many of the green products installed in a home can be easily identified, it's not so easy to judge the quality of installation. This can make a big difference in the performance of your home and its effect on your pocketbook.
